EXCLUSIVE: THE ALIEN SPACECRAFT CONNECTION!

By John R. Frick

For a period anti-dating 1983, there have appeared many suspicious images or circles etched upon the ground in wheat fields and other crop growth areas. They have been dubbed "crop circles" and have been found in worldwide locations.

Reports have been received from Australia, the United States, China, Japan and the United Kingdom. And while many researchers in the field of Ufology have attempted to explain such odd diagrams, they have offered their individual opinions in a "guessing game" that has a considerable following.

For the most part the guesses include "Euclidian geometry," "Mandelbrot Set," and "Diatonic Scale of Music," but is not limited thereto. It does not appear that any one opinion is more convincing than another, and there remains a stalemate proving the source of these strange configurations. Does this mean that a more obvious explanation has slipped by unnoticed?

As a contactee and researcher of thirty years, and that I have been working on a "Technological Description of the Disc-Type Alien Spacecraft," I always felt that the physical accomplishment could be attributed to no other sources. As I viewed the many photographs which the media produced, I felt that the "message" must be staring us in the face, but what was the "Key?"

And as I used the word key, I remembered a color photograph which showed a partial key or "tuning fork" as I would call it, almost hidden but none-the-less I could see a part of it. Checking the many photos, this "triple-pronged tuning fork" was always depicted.

The three tines could have some connection separating the color spectrum within the spheres. I finally found a photograph showing the triangle, and at each point, a circle depicting a sphere was observed.

Each circle was different, one with a wavy cross, one with broken lines, notched with "stops" and one was perfectly clear. The center mass as shown could be the "energy supply module," and the two rings surrounding this mass are rings of energy radiating away towards the spheres, or just the reverse.

Since the spheres are "mini-reactors" and that they produce "electro-magnetics" of the color spectrum, I believe the "picto-grams" are like a schematic diagram, indicating the different steps of the "atomic nuclear interchange" which occurs in the undercarriage of the spacecraft.

It is my considered opinion that these images are extractions of "atomic equations," as they apply to the process of converting raw electrical energy into electro-magnetics.

Only those individuals with backgrounds in "nuclear physics" should be able to recognize and decipher the blueprints which the Alien Forces placed where all could see... upon the ground!

To accelerate positive proof I am submitting this information to those with proper credentials.

And in the meantime, that which for the time period mentioned, was once considered a puzzle, should now be regarded as a part of the continuing proof of the existence of the Alien Spacecraft and their visitations to planet Earth.

Setting limits on cloning

By Maureen McTeer

SCIENTISTS ARE cloning human life. That was revealed last month in Montreal at a meeting of the American Fertility Society.

Should scientists have that power? Should society set some limits on cloning human life?

Four years ago, the Mulroney government created a Royal Commission on New Reproductive Technologies. Among some of the specific issues commissioners were required to examine were: "in vitro fertilization . . . prenatal screening and diagnostic techniques, genetic manipulation and therapeutic interventions to correct genetic anomalies (and) embryo experimentation."

These issues were urgent and fundamental to Canadians. Because of this urgency, the commission was asked to report its findings and make its recommendations within two years. The commission was entrusted with the broadest mandate of any country that had ever studied these issues and granted one of the largest budgets ever afforded a Canadian royal commission.

Now, two years after the commission was supposed to submit its findings, Canadians still wait for the results.

At the Montreal meeting, Dr. Robert Stillman of George Washington University Medical Centre reported that he had successfully applied methods of cloning routinely used in animals to clone human embryos. Cloning creates identical organisms with identical sets of genes. In cloning, animal embryos — and now human embryos — are split in half to create two identical embryos. In nature this would be called identical twins. In the laboratory, cloned human embryos would then be allowed to develop and be used for experimentation or implantation. They also could be frozen for future use.

In Canada, cloning in farm animals is done commonly down through several generations. For instance, an embryo, created in the laboratory by uniting an ovum and sperm, is allowed to develop to the two-cell stage, and is then split in half. The result is two identical embryos. Both then are allowed to develop to the two cell stage and are split again. The result is two more identical embryos, bringing the total to four. Theoretically, this process could be continued indefinitely.

Following Stillman's revelations in Montreal, we now know that cloning technology is being done on human embryos. Think what this means. In the name of helping the infertile, doctors and scientists have now crossed the last frontier. Before, using in vitro fertilization (called IVF), human life could be "created" in the laboratory.

Now, indefinite numbers of identical embryos can be cloned in the laboratory for use now or later. Without regulation or legislation defining the use to which such

GEOFFREY MOSS

human embryos created in vitro or through cloning can be put, scientific researchers can either experiment on this early human life, freeze it, or use it for implantation into an infertile woman or a fertile one serving as a surrogate.

Many may ask why we would ever want to "create" human clones of ourselves or our children in the first place? A partial answer was set out by Gina Kolata, reporting in the Sunday Oct. 24 New York Times.

She wrote "... parents might be able to save identical copies of embryos, so that if their child ever needed an organ transplant, the mother could give birth to the child's identical twin, a perfect match for organ donation. Or parents could keep a frozen embryo as a backup in case their child died, so that they could create the perfect replacement."

At the same meeting, researchers reported that oocyte (early ova) can now be taken from the fetuses of late-term abortions, matured in the laboratory and fertilized with sperm from an anonymous male. The embryo can then be implanted into a surrogate carrier (as is commonly done in farm animals), gestated and then delivered. The result, unprecedented in human history, is a child born of a child who herself was never born.

The issues raised by the use and development of IVF have yet to be addressed publicly, with all interested and informed Canadians participating. Yet it does not require a medical or science degree to understand the depth of the ethical, moral, legal and social issues they raise, and the urgency of regulatory and legislative action to protect the individual and collective

rights and freedoms all Canadians have come to cherish.

The federal government must introduce a set of guiding principles that articulate the nature of the issues at stake; and reconfirm our collective commitment to the principles and values of both individual and human rights guaranteed by Canadian laws and customs.

In particular, such guiding principles must have the effect of law, and must include the following points:

- ☐ With respect to these technologies, no human being can ever be used as a means to the ends of another.
- ☐ The human body, its parts and processes are not objects of commerce, and cannot be owned, bought or sold.
- ☐ The human body, its parts and processes cannot, under any circumstance, be the object of a patent.
- ☐ The interest of a human being to be "created" must prevail when a conflict arises involving reproductive technologies and genetic manipulation.

I believe that Canadians everywhere must speak out on these issues. The royal commission's report is overdue. The revelations last month in Montreal dramatize the urgency of these issues. There needs to be a context of public policy to determine what is acceptable scientific activity in the area of human reproductive technologies and human genetics. The new Parliament must make this a priority.

☐ **Maureen McTeer, a lawyer and former member of the Royal Commission on New Reproductive Technologies, is the author of *The Tangled Womb: The Politics of Human Reproduction*.**

NOT GUILTY, SAYS T.O. MAN**Pilot 'impostor' fights U.S. Navy**By TOM GODFREY
Toronto Sun

A Toronto-area man charged with impersonating a U.S. Navy officer pleaded not guilty in Florida yesterday.

Michael John Jacobus, 38, was ordered held without bail until his Jan. 3 trial in Pensacola.

U.S. District court heard yesterday that Jacobus has been posing as a Navy officer since 1984. He wore a navy uniform to his father's funeral, dress whites at his wedding and a flight suit on military bases, court heard.

Jacobus' navy uniforms fooled two ex-wives, family members, girlfriends and the U.S. Navy for nearly 10 years, said navy investigator Diane Nelson.

Jacobus alleged he was a commander of the U.S. Navy, stationed at NASA as a test pilot and was working on a joint billet for

the U.S. department of defence on the joint primary air training system.

Navy officials said there's no evidence yet that Jacobus ever flew any of their aircraft but the probe is continuing.

He could face up to three years in prison and a \$250,000 fine if convicted.

He allegedly told his second wife and family members he was a fake in 1988 before moving to the Toronto area.

Jacobus, a landed immigrant in Canada, returned to the U.S. last June. His wife and daughter, 2, live in Toronto.

Navy officials said he allegedly posed as a test pilot and top gun flyer at naval air stations in Pensacola, Marietta, Ga., Patuxent River, Md., and Oceana, Va., where he was arrested Oct. 29.

Jacobus also posed as an officer at a recent air show in Hamilton, Ont. navy investigators allege.

Squirrel knocks out power

ST. CATHARINES (CP) — A squirrel that walked one too many hydro wires was blamed for a transformer explosion that cut power to about 50,000 homes, schools and businesses for about an hour yesterday morning.

The squirrel apparently got into the city's hydro system, causing the blowout, said Ontario Hydro workers at a transformer station that feeds electricity to much of the city.

The downtown core was hardest hit. Coffee pots in offices and restaurants stopped dripping, phone systems stopped working and office workers stood around chatting and waiting for the power to come back on.

Could there be a connection?

The mysterious disappearance of Jason Petrie in Algonquin Park reminds me of another mysterious disappearance in the same region: Mark Lam who disappeared on Nov. 3, 1991.

Lam's disappearance on a wilderness camping trip has never, to my knowledge, been solved. Could there be a connection? By any chance have there been others?

RUTH MALLOY
Toronto**Israelis find 5,000-year-old skeleton of soldier in cave**

JERUSALEM (AP) — Archeologists have discovered the 5,000-year-old skeleton of a soldier buried in a West Bank cave with his bow and arrows.

The well-preserved skeleton was found wrapped in a straw mat in a cave north of Jericho, a

statement from the Israeli government's Antiquities Authority said yesterday. The skeleton was lying on armor.

The skeleton was found during Operation Scroll, Israel's search for any remaining Dead Sea scrolls in caves near Jericho

and the Dead Sea before ceding authority to Palestinians in the occupied West Bank.

The operation has been criticized by Palestinians and some Israelis as last-minute plundering contrary to the peace process.

The Antiquities Authority said the soldier was about 40 at the time of his death and had probably hidden in the cave during the Canaanite period of settlement, which lasted from 3000 to 1200 BC.

Man evicted, his snakes must go, tooBy Wendy Darroch
TORONTO STAR

A man's dream of having the largest collection of reptiles in the country has been shot down by the Ontario Court, general division.

In a 19-page decision released in Ottawa yesterday by Mr. Justice Kenneth Binks, Todd Legault has been ordered out of his girlfriend's townhouse on Woodridge Cres. in Nepean.

The 26-year-old was also ordered to take his five pythons, five boa constrictors, two tarantulas, four lizards and four other reptiles with him.

The problem started on June 21, when Taipan, Legault's 6-metre (20-foot) reticulate python, crawled between the bedroom window and screen in an attempt to escape, Binks noted.

A group of children playing below alerted their parents.

The judge noted the townhouse was in a large residential neighborhood linked by a common sewer system.

Tenants feared for their safety and particularly for their children's safety, and many signed a petition to get rid of the reptiles. As a result of an article in the Ottawa Citizen, there were 20 per cent fewer applications to lease premises in the complex than the week before the incident.

Not only did Binks order Legault and his zoo to leave, he ordered his girlfriend, Sue Nuttall, and her sister, Mary Carter, who were the tenants, to get out.

The judge said they had allowed Legault to move in without the landlord's knowledge and had also changed the locks on the door, contrary to their lease.

Let's move into space, prof says

GLASGOW, Scotland (Reuter) — The planet Earth is too polluted and overcrowded and its billions of people should consider moving into space, returning only for vacations, a prominent Russian scientist said yesterday.

"Mankind should live in space and the Earth should rest. You could return to earth and visit where your parents came from," Prof. Nikolai Agajanyan, a veteran of the former Soviet Union's space program, told a news conference at the International Congress of Physiological Sciences in Glasgow.

Babies could safely be conceived and born in space, he said, citing the fact that several generations of animals had been bred in non-gravity conditions.

And diseases such as heart problems and varicose veins would be better treated in space, he added.

Australian worm hunt turns up new species

CANBERRA (Reuter) — Australian scientists have found at least 15 new species of native earthworm after a year-long national worm-hunt by 1,500 students, who sent worms in the mail that they had unearthed from their own gardens. The project saved at least five years of research, according to scientist Geoff Baker.

U.S., Russia eye 2001 space odyssey

WASHINGTON (AP) — The United States plans to send 10 shuttle flights to the Russian space station Mir as the two countries work jointly to build an international space station.

An expanded agreement between the two nations involving assembly flights through to the year 2001 was released yesterday by U.S. President Bill Clinton's administration.

"This plan describes a new relationship between the U.S. and Russian space agencies which will advance their national space programs and benefit their respective national aerospace industries," the document said.

It was signed Nov. 1 by Daniel Goldin, administrator of the National Aeronautics and Space Administration, and Yuri Koptev, general director of

the Russian Space Agency.

The plan expands on an agreement to fly a cosmonaut on a shuttle mission next January and to launch a U.S. astronaut to the Mir in 1995.

The shuttle will carry new solar arrays to replace the existing ones on Mir. Russia will add two laboratory modules outfitted with U.S. and Russian hardware to the Mir.

Licorice pastilles blamed for blue skin and green blood

CHICAGO (Special) — Eating licorice became a colorful pastime for a Finnish man, who turned blue after consuming large amounts of the candy for a month.

The 41-year-old man, who was admitted to the Helsinki University Medical Hospital with blue skin, said he had eaten four boxes of salted licorice pastilles every day for the past month, his doctors report.

Three other patients experienced similar reactions after eating the licorice for a month, the

doctors report in the latest issue of the medical journal *The Lancet*.

One of the patients was a 45-year-old man "who was sent to the hospital because of the dark-green color of his face," reported Dr. Veli-Jukka Anttila. The man said he had eaten three boxes of the licorice every day for three weeks.

The other two patients were sent to the hospital because they had green blood; they also ate several boxes of the licorice daily. All four had been eating the same brand of licorice pastilles, called Haganol, which is manufactured in Finland.

"We decided to test a healthy volunteer, who ingested five boxes per day of the pastilles for six days," Anttila wrote. The volunteer's blood got progressively darker each day, he reported.

The discoloration disappeared in all the patients several months after they stopped eating the licorice, the doctors reported.

The doctors speculated that the discoloration may have been caused by batches of licorice manufactured in the summer of 1991 that were probably contaminated with an unidentified pigment, most likely an extract of the licorice root.

The pastilles made after this date do not contain such a pigment, Anttila said.

Eating large amounts of licorice also has been associated in the past with high blood pressure and potassium deficiencies.

Worms yield key to longevity

NEW YORK (AP) — An alteration in a single gene makes worms live more than twice as long as normal.

The finding may give clues for a healthier old age in people, a scientist says.

Worms with the mutated gene "looked pretty happy and healthy" while their obviously aged contemporaries were dying, said Cynthia Kenyon.

"That's really exciting. We want to understand how that can happen," said Kenyon, an associate professor of biochemistry at the University of California, San Francisco.

It's not clear yet whether the answer would have any implications for humans, but many biological processes seen in the worm are duplicated in people, she said.

Parrots turn into stool pigeons

ADELAIDE, Australia (AP) — A bird breeder who tried to smuggle four exotic birds into Australia by stuffing them into his underpants overlooked one detail: The birds were parrots.

Leli Ellul, 35, was fined the equivalent of \$14,625 U.S. yesterday. He arrived

at Adelaide International Airport in March on a flight from Bangkok.

Customs officers grew suspicious when they found bird droppings and feathers in his baggage. But what gave Ellul away was the birds' loud chirping, a prosecutor said.

On closer inspection, officers found four Thai baby moustache parrots in Ellul's underpants. The birds are worth up to \$13,000 U.S. on the black market.

Ellul, a carpenter who breeds birds, pleaded guilty to having breached wildlife protection and quarantine laws. He had transported the birds in his suitcase, but transferred them to his underpants after collecting his luggage.

Use sunbeams to zap asteroids, study urges

TUCSON, Ariz. (AP) — An asteroid on a collision course with Earth could be diverted from its doomsday path by a concentrated sunbeam, researchers suggest.

Scientists H.J. Melosh and I.V. Nemchinov reported yesterday in the British journal *Nature* that a giant orbiting mirror could focus a tight beam of sunlight on the asteroid, vaporizing enough of it to move it slowly aside.

THE TORONTO STAR Sunday, November 21, 1993

Robot aircraft flies on 60% solar power

SAN FRANCISCO (Reuters) — An aircraft being developed for the Pentagon has been successfully flown in a test flight powered partly by solar power, researchers say.

The Pathfinder — an unmanned aerial vehicle that looks like a flying wing — completed a flawless first test flight on solar power last month at Edwards Air Force Base in California, the Lawrence Livermore National Laboratory reports.

The Pathfinder project grew out of former president Ronald Reagan's Strategic Defense Initiative. That plan, aimed at creating an anti-missile defensive shield around the United States, has now been drastically scaled back.

The idea is that the Pathfinder would

fly high over a battlefield for weeks or months powered by solar energy. It would be equipped with sensors to detect short range ballistic missiles fired by an enemy and would fire small interceptor missiles to destroy them.

The wing-shaped aircraft is 30 metres long and 2.4 metres wide, weighs just 195 kilograms and is powered by eight electric-motor driven propellers.

The aircraft reached an altitude of about 200 feet during the 41-minute test flight as it traveled six times around a 2,000 metre race track course, the laboratory said.

Its speed was about 25 km/h and at least 60 per cent of the power needed to stay in the air was provided by solar cells on the aircraft's wing surface,

with the rest coming from batteries.

"Everything worked very well and we're very happy with the results — we have lots of test data," says Ray Morgan, a vice-president of AeroVironment Inc, which designed and built the aircraft.

Five more test flights are planned, followed by upgrades to the systems that will enable high-altitude flights above 65,000 feet next summer, the laboratory said.

The Pathfinder aircraft development is sponsored by the Ballistic Missile Defense Organization, a government agency, with technical management provided by Lawrence Livermore National Laboratory.

DISCOVERY DIGEST

People who see flying saucers are not nuts. Neither are folks who claim to hitch rides with extraterrestrials, Canadian researchers report.

A team of scientists led by Dr. Nicholas P. Spanos of Ottawa's Carleton U. gave a battery of psychological tests to people who claim to have close encounters of one kind or another, and compared the results with tests given to people who make no flying saucer claims.

The results, published in the *Journal of Abnormal Psychology*, show the people who claim to have seen and even ridden in UFOs are just ordinary folks with normal imaginations.

"We can't say these sightings are real or not, but we can say that these people are not necessarily abnormal," Spanos said in a statement from the American Psychological Association.

Spanos said that the UFO sighters "tend to be white-collar, relatively well-educated representatives of the middle class."

Spanos said the only significant difference between the UFO sighters and the others was that those who reported flying saucers had previously established belief in the existence of UFOs and in aliens.

'Star Wars' proteins help in transplants — from pigs

ST. LOUIS (AP) — "Star Wars" failed but the concept — and pigs — may save lives.

Pigs have been produced with kidneys and hearts safe for transplant into humans, researchers say.

And proteins that scour the body like "Star Wars" defence systems to keep it from rejecting its own organs have been used to produce the "safe" pigs.

"The hope is these organs, when transplanted into man, would be rejected very slowly or not at all," said Dr. John Atkinson of the Washington University School of Medicine in St. Louis.

Atkinson called them "Star Wars" proteins because they prevent immune system attacks in the way that the now abandoned U.S. "Star Wars" defence system was intended to prevent nuclear missile attacks.

Researchers believe pig-to-human organ transplants could be routine in less than a decade.

Human transplants of unaltered pig organs have been tried several times but the organs have been quickly rejected.

Now pigs have been grown with organs coated with the protective human proteins.
